

EXECUTIVE BRIEF

SynapseITSM

An AI-powered IT support platform that diagnoses and resolves technical issues automatically — while keeping humans in control of every fix.

PREPARED FOR BUSINESS STAKEHOLDERS • CONFIDENTIAL

▣ What It Is

SynapseITSM lets employees describe IT problems in plain language and have them automatically triaged, diagnosed, and fixed — with a mandatory human approval checkpoint before any change is applied. It replaces slow, manual help-desk ticket handling with an intelligent system that investigates root cause and remediates issues end-to-end, including directly on a user's PC or laptop.

▣ The Business Problem It Solves

Today's Pain	SynapseITSM's Answer
Help-desk tickets sit in queues for hours	Common issues resolved in seconds , automatically
Senior IT staff burn time on repetitive problems	Routine fixes automated; staff focus on real escalations
Outages are detected by users, not the system	Built-in monitoring catches failures before users report them
Knowledge walks out the door when staff leave	The system learns from every resolved ticket and improves over time

▣ How It Works

- 1 **An employee reports a problem** through a simple chat window (e.g. "the sales dashboard is down").
- 2 **The AI instantly checks** whether it has seen this issue before and can answer immediately.
- 3 **If it's a real incident**, the system reads live system-health data and maps service dependencies to pinpoint the true cause.
- 4 **It proposes a specific fix** from a library of approved repair procedures ("runbooks").
- 5 **An IT operator reviews and approves** the fix with one click — nothing runs without human sign-off.
- 6 **The fix is applied, verified, and the ticket closed** automatically. Failed fixes are escalated with an email alert.

▣ Key Differentiators

Human-in-the-Loop safety — Every corrective action requires explicit operator approval. The AI recommends; people decide. Critical for governance and risk control.

Remote remediation — Approved fixes can be applied directly to an employee's PC or laptop, even off-site, with no technical effort from the user.

Proactive monitoring — A background agent watches infrastructure 24/7 and opens high-priority tickets automatically the moment something breaks.

Self-improving knowledge base — Each resolved case feeds back into the system, continuously raising the automatic resolution rate.

Full audit trail — Every proposal, approval, and action is logged for compliance and reporting.

▣ Business Value

- ✓ **Faster resolution** — routine incidents handled in seconds instead of hours.
- ✓ **Lower support cost** — fewer tickets reach human agents; staff are deployed where they matter.
- ✓ **Reduced downtime** — early detection and automated fixes shorten outages.
- ✓ **Consistency & compliance** — every action follows an approved procedure and is fully logged.
- ✓ **Scalability** — absorbs growing ticket volume without proportional headcount growth.

▣ Maturity & Technology

The platform is built on a modern, enterprise-grade foundation: multi-agent AI orchestration, secure role-based access, a containerized database, and a dedicated operations dashboard for the IT team. It supports

flexible AI model providers, keeping it cost-effective and adaptable as the business scales.

*SynapseITSM turns IT support from a reactive, manual cost center into a **proactive, self-improving, mostly-automated service** — while keeping humans firmly in control of every fix.*
